# RodentArmour+ *Compound*

Deterrence starts in the material.

## Focused on one thing. Improving every day.

Solar panel bird protection is all we do. That focus has given us a firm grasp of all aspects of this problem, and the drive to keep improving our answer to it.

**RodentArmour+ Compound** is the latest example of that.

## The same trusted protection. Quietly improved.

BirdBlocker has spent years proving one simple truth: keep birds out, and you keep everything else out too. Rats, raccoons and martens follow nesting birds: remove the nest, and you remove the attraction. It works. It has always worked.

We thought we could do a little better still.

## Introducing RodentArmour+ *Compound*

Metal wire and plastic alike offer little resistance to a determined rodent, and when motivation strikes — whether rat, marten, squirrel, or raccoon — solar installations pay the price. The solar protection industry has largely accepted that as an uncomfortable fact. We didn't.

**RodentArmour+ Compound** is an industry first: an active rodent deterrent integrated directly into the HDPE material used across the full BirdBlocker range. Not a coating. Not an afterthought. Compounded into the plastic itself.

**RodentArmour+ Compound** works through chemosensory deterrence, the agent introduced into our HDPE is offputting to rodents on taste and smell contact, discouraging gnawing before damage occurs. Because it is compounded throughout the material rather than applied to the surface, the active agent is surface-persistent, present at the point of contact from the moment the product leaves our facility.

**No fuss. No maintenance. No change to installation.**

## Built into every product. From here on in.

**RodentArmour+ Compound** is now standard in all BirdBlocker products. Every BB85, BB125 and BB200 that leaves our facility contains **RodentArmour+ Compound** as part of its HDPE composition.

Nothing to specify. Nothing to add. It's simply there.

## A word on what to expect

**RodentArmour+ Compound** is an active deterrent. A meaningful additional layer of security built on products that have already proven their worth. Where birds are kept out, rodents lose their motivation. **RodentArmour+ Compound** takes that further, actively discouraging any interest before it becomes intent. From this point forward, that protection comes standard with every BirdBlocker.
